

Project Design Phase-I

Solution Architecture

Team ID	PNT2022TMID44028
Project Name	Project – Natural Disaster Intensity Analysis and Classification Using Artificial Intelligence

Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behaviour, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Example - Solution Architecture Diagram:

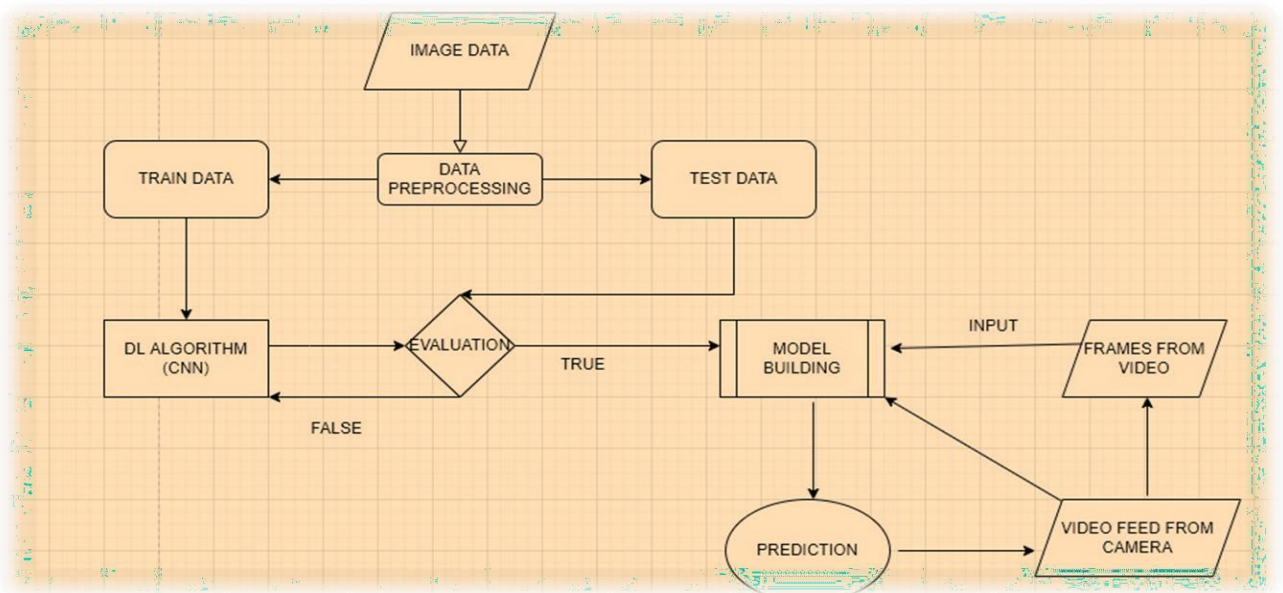

Fig 1. Architecture and Flow Diagram to classify the natural disaster using Deep Learning Algorithm.
